SDC Hackathon 2026 · Domain 1 · SDG 4 and SDG 8

SkillFolio

Your skills are a portfolio. AI is the market.

Team MIX MECHS · University of Southampton Malaysia

The problem

Graduates can't tell if what they're learning is working

66.0%

of Malaysian graduates aged 24 and under worked below their qualifications in 2024 (DOSM, Graduates Statistics 2024)

Meet Aina, 23

A business-analytics graduate in Kuala Lumpur. She has about 200 hours to learn this year and little money. Everyone says "learn AI", but she can't see which of her skills are in demand, which roles she could reach, or whether her last course got her any closer.

- Resumes are fixed on the day they're written
- Career tests give one answer
- Course sites track completion, not progress to a job
- Chatbots can make up jobs, courses and numbers

Also: more than 600,000 Malaysian workers will need to reskill within three to five years (MOSTI, January 2025)

The solution

A resume becomes a skill portfolio you keep up to date

1

Paste a resume

We find skills from a list of 73. With the RunPod AI model on, it also suggests skills the resume describes without naming. You confirm each.

2

See the market

Demand for each skill from 7,961 dated job posts over 25 months, with AI exposure, under two AI scenarios.

3

Match roles

20 roles ranked by fit, with what's missing and which UN goals each one serves.

4

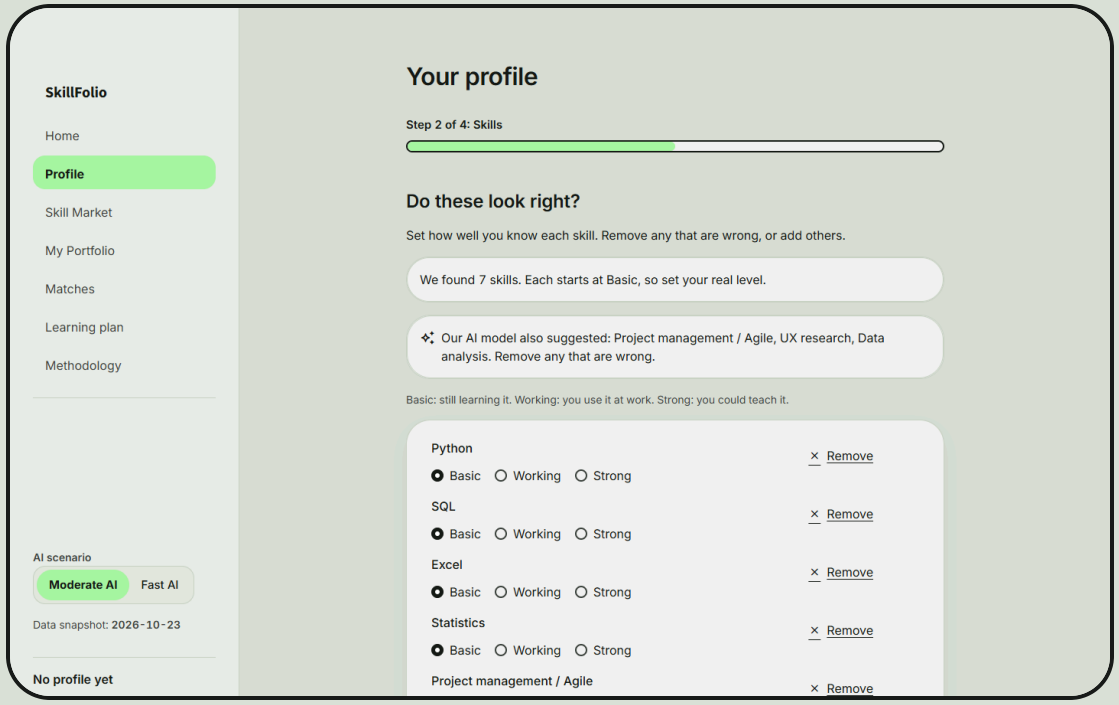

Learn and track

Free courses in order. Mark one done and your skill level and fit update.

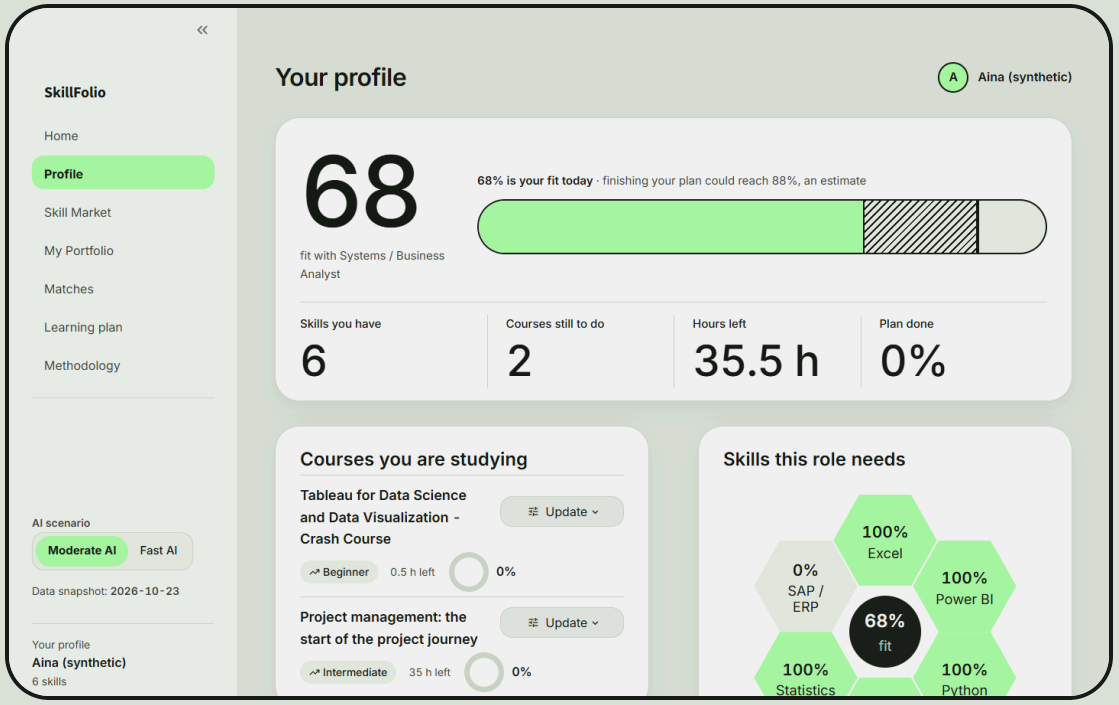

Every number shows its source and date. The app can only recommend roles, skills and courses from our checked lists.

The app

From resume to portfolio

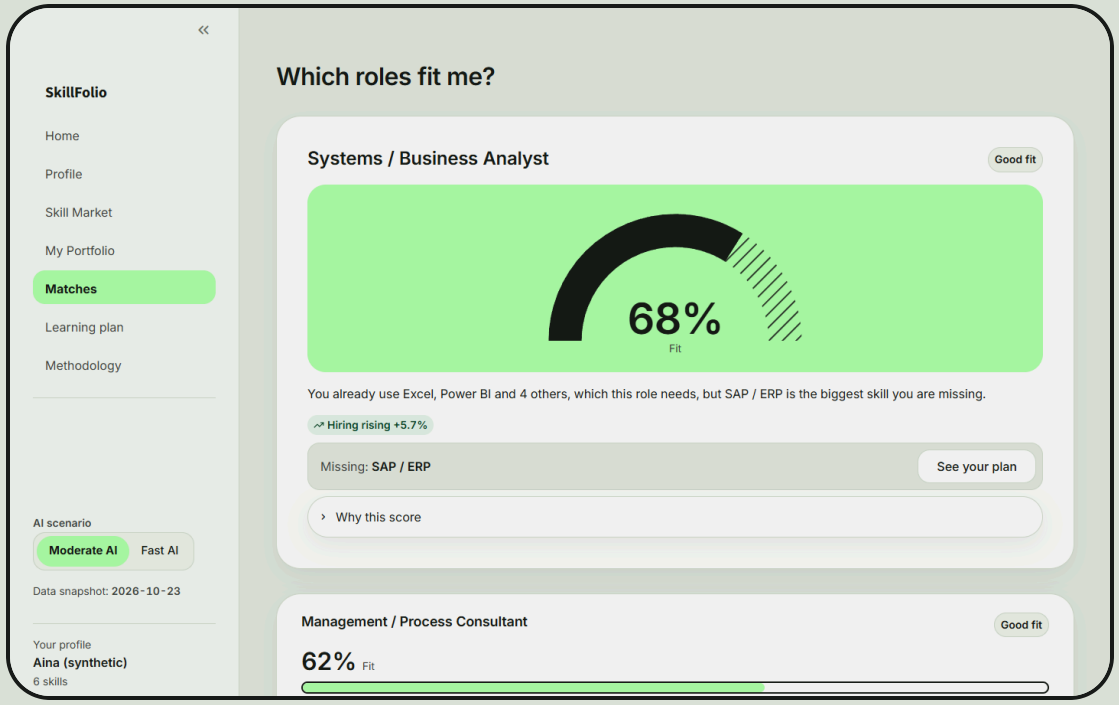

With the RunPod AI model on, a made-up resume gets these suggestions: project management, UX research, data analysis

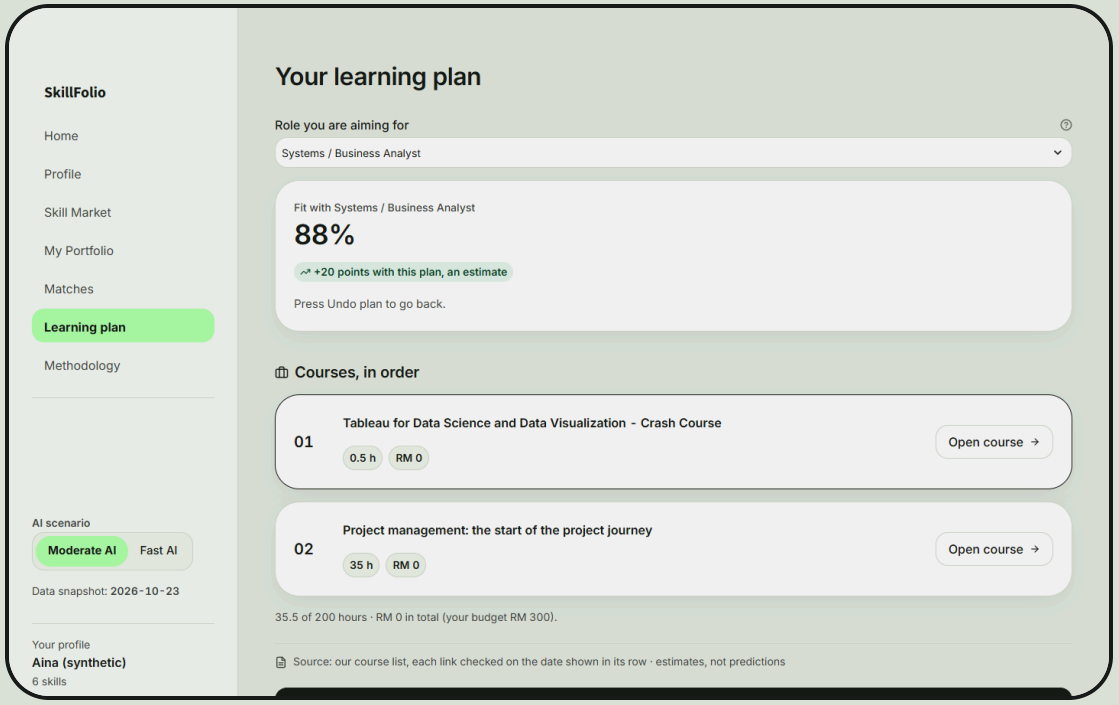

The profile page: fit, plan progress, hours left

The app

Roles that fit, and a plan to close the gap

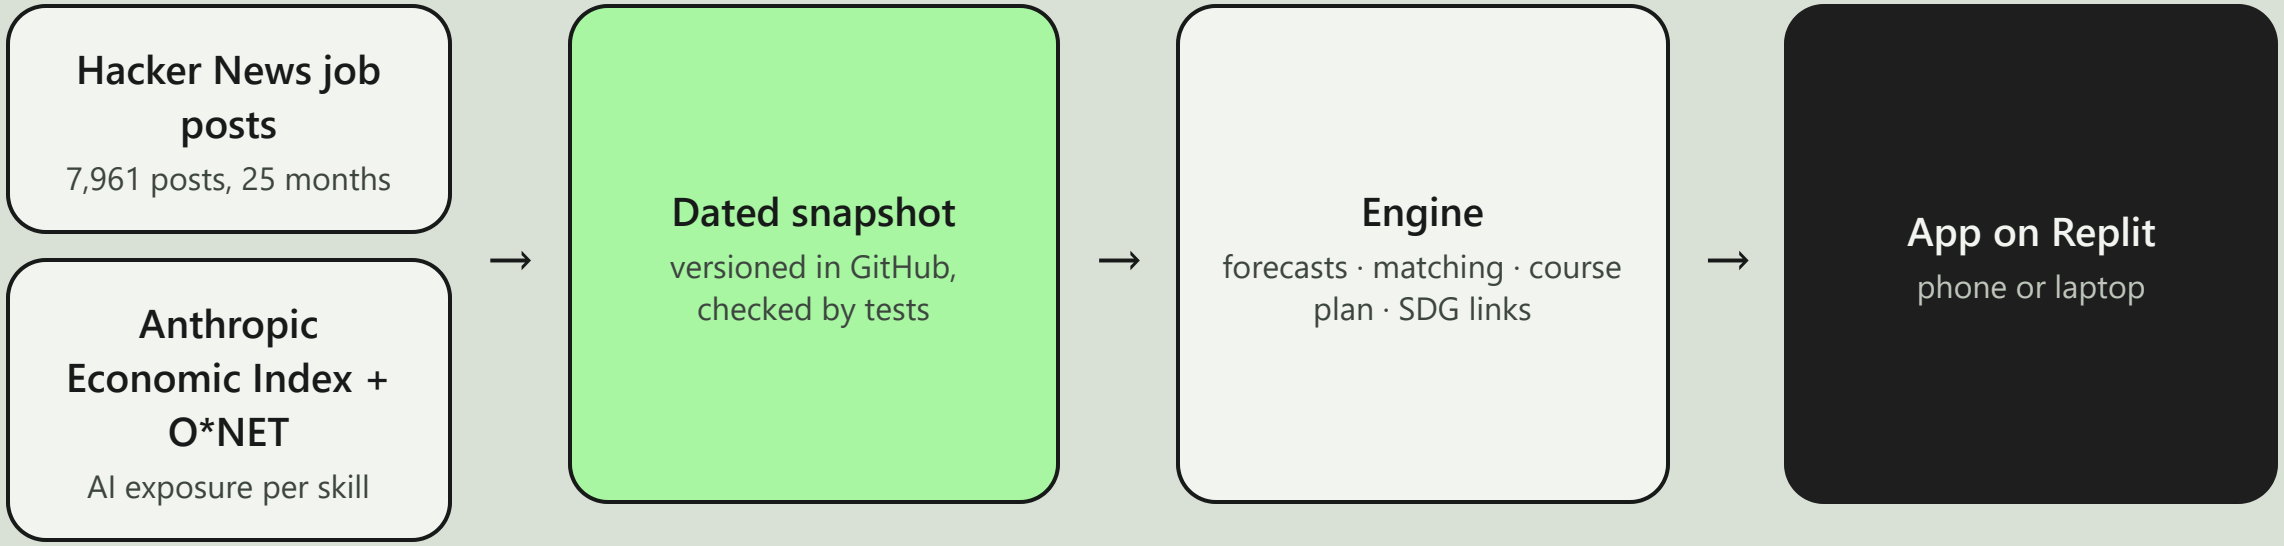

Ranked roles with a fit score, the reason, and the biggest missing skill

"Apply plan" shows how fit changes if the courses are done

How it works

Real data in, nothing made up out

AI on RunPod

An open model (bge-small) on a RunPod GPU picks matching skills from our list. The public demo runs in keyword mode.

Never invents

The model only ranks ids we send it. Roles, skills and courses come from checked lists.

You decide

The user confirms every suggested skill. SkillFolio supports a decision; it never makes one.

Impact

Skills for jobs: SDG 4.4 and SDG 8.5

What we measure

- Fit with the target role, before and after the plan
- AI exposure of the portfolio, before and after
- Share of recommendations with a source and date
- Time from profile to plan

Phase 2 targets

- 20% higher fit on average across our five test personas
- 10% lower AI exposure
- 100% of recommendations sourced and dated
- Profile to plan in under 3 minutes

Baseline: 66.0% of graduates aged 24 and under are underemployed (DOSM 2024). Targets, not results.

Honest limits, and what's next

What it can't do yet

Today

- Tech and data roles only
- Course progress is ticked by the user
- A portfolio lasts one session
- Job posts are mostly US and remote, not Malaysian
- Forecasts are estimates, not predictions

Phase 2

- Saved portfolios so users can return
- Malaysian job data, so other industries are covered
- Bahasa Malaysia
- Run the AI model over job posts too

Team MIX MECHS · University of Southampton Malaysia

Four people, one portfolio

Name	Role
Jaiydaan (leader)	Engine, RunPod, team lead
Atheek	Data and trends
Kuhan	App and Replit
Oscar	Research, SDG and pitch
